

Have you thought about different options for sexually-transmitted and blood-borne infection (STBBI) testing?

We are conducting a study of **key populations and the general public's preferences and attitudes towards STBBI testing**. Researchers led by Dr. Aslam Anis at the University of British Columbia are doing this research to better understand testing preferences, to improve the uptake of STBBI testing and to enable early diagnosis and treatment.

We are looking for members of the gay, bisexual and other men who have sex with men community (19+ years) who are willing to participate in a focus group discussion.

If you would like to learn more about what's involved in participating, please contact **Paige Tocher** at preferences@cheos.ubc.ca

In thanks for your time and expertise, we'll reimburse you with a **\$25 gift card**.
